

Planisphera

Declaration of Principles

The fundamental purpose of Planisphera is to promote an ecological, inclusive, and equitable transition of the economy. We recognize that adopting a holistic vision—one that places nature and human rights at its core—requires addressing present needs within existing systems and structural constraints. However, these systems are insufficient to meet the needs of all people today, and even less so those of future generations. We are convinced that transforming these structures is not only possible, but essential and urgent.

To this end, Planisphera supports the development and implementation of public and private policies, programs, and initiatives grounded in measurable and achievable goals. These goals are defined through participatory processes and informed by the best available knowledge, enabling diverse stakeholders to act within planetary boundaries while addressing social needs, equity, and cultural diversity.

We are committed to fostering the evolution of human systems, communities, and organizations so they can thrive in a carbon-neutral economy that respects nature and benefits all living beings within socio-ecological systems. Planisphera promotes the full realization of economic, social, cultural, and environmental rights, prioritizing human well-being and the fulfillment of needs over profit and material accumulation.

Members and collaborators of Planisphera strive, through their daily actions, professional work, and relationships, to contribute to the development of a more just, supportive, and human-centered society. We are committed to supporting the recovery of biodiversity, biogeochemical cycles, and the climate system from the increasingly severe impacts of human activity.

The COVID-19 pandemic has exposed a deep and interconnected social, environmental, economic, and climate crisis. Addressing this crisis requires a transformative recovery process toward sustainable economies and inclusive societies, in which:

- The economic model is reoriented to incorporate social, environmental, and non-economic dimensions.
- No one is left behind or excluded.
- Decarbonization, biodiversity conservation and restoration, resilience, and climate adaptation are actively advanced.
- Biodiversity is fully integrated into decision-making across all sectors, recognizing its multiple values.

- Transition pathways are supported through practical, scalable solutions that make a sustainable economy tangible across sectors and levels.

In light of these principles, our work is grounded in scientific evidence and in the most accurate possible understanding of the Earth and its societies. Our aim is to design and implement solutions that advance social justice while addressing the profound challenges facing our planet.
